No part of this document may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying and recording, for any purpose, without the express written permission of Marvell. Marvell retains the right to make changes to this document at any time, without notice. Marvell makes no warranty of any kind, expressed or implied, with regard to any information contained in this document, including, but not limited to, the implied warranties of merchantability or fitness for any particular purpose. Further, Marvell does not warrant the accuracy or completeness of the information, text, graphics, or other items contained within this document. Marvell products are not designed for use in life-support equipment or applications that would cause a life-threatening situation if any such products failed. Do not use Marvell products in these types of equipment or applications.

With respect to the products described herein, the user or recipient, in the absence of appropriate U.S. government authorization, agrees:

- 1) Not to re-export or release any such information consisting of technology, software or source code controlled for national security reasons by the U.S. Export Control Regulations ("EAR"), to a national of EAR Country Groups D:1 or E:2;
- 2) Not to export the direct product of such technology or such software, to EAR Country Groups D:1 or E:2, if such technology or software and direct products thereof are controlled for national security reasons by the EAR; and,
- 3) In the case of technology controlled for national security reasons under the EAR where the direct product of the technology is a complete plant or component of a plant, not to export to EAR Country Groups D:1 or E:2 the direct product of the plant or major component thereof, if such direct product is controlled for national security reasons by the EAR, or is subject to controls under the U.S. Munitions List ("USML").
- At all times hereunder, the recipient of any such information agrees that they shall be deemed to have manually signed this document in connection with their receipt of any such information.

Overview

This software release package contains source code for the Marvell® ARMADA® 610 Tablet Reference Platform for Android™ 3.2. Linux® kernel 2.6.35.

The release package includes:

- Prebuilt binaries Use to flash the ARMADA 610 Tablet Reference Platform; these binaries are ready for immediate use.
- Source code Customize and build the code to create new binaries.

THIS SOFTWARE IS PREPRODUCTION SOFTWARE. IT CANNOT BE USED "AS IS" FOR PRODUCTION SYSTEMS. NO WARRANTY, EXPRESSED OR IMPLIED, IS TO BE ASSOCIATED WITH THIS SOFTWARE AND THE USER ASSUMES ALL RISKS.

For the latest Marvell documentation and the latest Marvell software and hardware updates, contact your Marvell representative.

1.1 **System Requirements**

1.1.1 **Hardware Requirements**

This release requires the Marvell ARMADA 610 Tablet Reference Platform with A0/A1/A2 stepping of the ARMADA 610 processor and 1 GB of DDR3 memory.

All applicable Engineering Change Orders (ECOs) for a particular hardware revision must be applied to ensure that the software operates properly.

For the ECO level supported by this release and for ECO documentation, see Table 1.

Table 1: ECO Information for ARMADA 610 Tablet Reference Platform

| ECO Level Requirement | Document | Document Number |
|---|--|-----------------|
| Revision 1 PB number: F00055-100 ECO level: ECOs 1 through 22 (0x3FFFFF) | Marvell [®] ARMADA™ 610 Tablet Reference Platform, Revision 1 Engineering Change Orders | MV-S501271-00 |
| Revision 2 • PB number: F00055-200 • ECO level: ECOs 1 through 12 (0xFFF) | Marvell [®] ARMADA™ 610 Tablet Reference Platform, Revision 2 Engineering Change Orders | MV-S501274-00 |
| Revision 3 • PB number: F00055-300 • ECO level: ECOs 1 through 8 (0xFF) | Marvell [®] ARMADA™ 610 Tablet Reference Platform, Revision 3 Engineering Change Orders | MV-S501275-00 |
| Revision 4 • PB number: F00055-400 • ECO level: ECO 9 (0b1001) | Marvell [®] ARMADA™ 610 Tablet Reference Platform, Revision 4 Engineering Change Orders | MV-S501286-00 |

The printed board (PB) number F00055 identifies the board as a Marvell ARMADA 610 Tablet Reference Platform. The -100, -200, -300, and -400 indicate revision 1, revision 2, revision 3, and revision 4, respectively, of the unpopulated board and schematics.

For the ECO level, an ECO label is applied to the board that encodes the numbers of the ECOs added to the board into a hexadecimal number. Refer to the appropriate Engineering Change Orders document for detailed ECO information.

Software Requirements 1.1.2

This release version requires:

Host PC with operating system – Ubuntu® 10.04

Marvell routinely tests the Android build on Ubuntu 10.04. Marvell recommends using Ubuntu 10.04 and manually upgrading the Git to v1.7.1 or later. You can download the Git package from http://git-scm.com/download.

Follow the instructions on http://source.android.com/source/download.html to set up the Android build environment on Ubuntu Linux.

Android 3.2, Linux kernel 2.6.35

1.2 **Platform Features**

Table 2 lists the platform features for this version of the Marvell ARMADA 610 Tablet Reference Platform for Android 3.2 release package.

Platform Features (Sheet 1 of 3) Table 2:

| Features | | Support |
|-------------------------|---|---------|
| General Android Version | | 3.2 |
| | Linux kernel | 2.6.35 |
| Power Management | Android power integration | Yes |
| | Battery information | No |
| | Suspend/Resume | Yes |
| Video Playback | Video output to HDMI™ | Yes |
| | Video output optimized by overlay | Yes |
| | Simultaneous video output to HDMI and UI operation on LCD | Yes |
| | Simultaneous different video content playback on HDMI and LCD | No |
| | Video rotation | Yes |
| | Video output through graphics controller | No |
| Audio Playback | Headset switch detection | Yes |
| | Audio driver integration | Yes |
| | Audio to headset | Yes |
| | Audio to speaker | Yes |
| | Audio to HDMI | Yes |

Doc. No. MV-S302102-00 Rev. -CONFIDENTIAL Copyright © 2011 Marvell August 25, 2011 Page 6

Table 2: Platform Features (Sheet 2 of 3)

| Features | | Support | |
|-----------------------|--|------------------------------|--|
| Audio Recording | AMR-NB encoding | Yes | |
| | AAC encoding | Yes | |
| | Sound recorder integration | Yes | |
| Video Recording | Camera stack integration | Yes | |
| | Camera sensor tuning | Yes | |
| Touch | Single touch | Yes | |
| | Multiple touch | Yes | |
| Bluetooth® technology | Bluetooth base stack | Yes | |
| | Advanced Audio Distribution Profile (A2DP) | Yes | |
| | Object Push Profile (OPP) | Yes | |
| | Human Interface Device (HID) Profile | Yes | |
| | Personal Area Networking (PAN) Profile | Yes | |
| | Audio/Video Remote Control Profile (AVRCP) | Yes | |
| Sensors | Gravity sensor | No | |
| | Light sensor | No | |
| | Proximity sensor | No | |
| Light | LCD backlight | Yes | |
| | Keypad backlight | Yes | |
| Alarm | Trigger alarm from Standby | Yes | |
| Wireless | Wi-Fi [®] access without password | Yes | |
| | Wi-Fi Protected Access (WPA)/WPA2 | Yes | |
| | Wi-Fi WPA Enterprise Protected Extensible Authentication Protocol (PEAP) Tunneled Transport Layer Security (TTLS) Transport Layer Security (TLS) | Yes | |
| | Wi-Fi Wired Equivalent Privacy (WEP) | Yes | |
| | Wi-Fi Mobile Hotspot | Yes | |
| | Wi-Fi connection stress test | Yes | |
| | 3G USB Dongle | No | |
| Multimedia | GStreamer | See Table 3, Supported Media | |
| | Stagefright | Format and Codecs, on page 9 | |
| Video Output | Output through graphics controller | No | |
| | Output through overlay | Yes | |

Table 2: Platform Features (Sheet 3 of 3)

| Features | Support | |
|---------------|---|-----|
| Tools | Android Debug Bridge (ADB) integration | Yes |
| | Marvell Code Performance Analyzer integration | Yes |
| Graphics | 2D/3D graphics controller (GC860 ¹) | Yes |
| User Storage | SD card | Yes |
| | Internal storage partition | No |
| Boot Storage | eMMC | Yes |
| | SD | Yes |
| System Update | Fast boot protocol | Yes |
| | SD upgrade | Yes |
| | Factory reset | Yes |
| Security | Wireless Trusted Platform Service Package (WTPSP) | Yes |
| | Wireless Trusted Module (WTM) Adapter for Linux Kernel Crypto Framework | Yes |
| | Optimized OpenSSL | Yes |

^{1.} GC860 refers to the Vivante Corporation GCCORE Graphics Processing Unit IP architecture.

1.3 Multimedia Features

This release supports the media formats and the codecs listed in Table 3.

Table 3: Supported Media Format and Codecs (Sheet 1 of 2)

| Containers | Extensions | | Audio/Video Combinations | | Status |
|------------|------------|---------------|-----------------------------|---------------|--------|
| | | Audio | Video | | |
| ASF | .asf | WMA | MPEG-4 | GStreamer | Ready |
| | .wmv | WMA | WMV | | |
| | .wma | WMA | | | |
| AVI | .avi | MP3 | H.264 | GStreamer | Ready |
| | | MP3 | MPEG-4 | | |
| | | MP3 | H.263 | | |
| MOV | .mov | AAC | H.264 | GStreamer | Ready |
| | | AAC | MPEG-4 | | |
| MP4 | .mp4 | AAC | H.264 | Stagefright R | Ready |
| | | AAC | H.263 | | |
| | | AAC | MPEG-4 | | |
| | | AMR- NB/WB | H.264 | | |
| | | AMR- NB/WB | H.263 | | |
| | | AMR- NB/WB | MPEG-4 | | |
| | .m4a | AAC | | | Ready |
| | | AMR- NB/WB | | | |
| | .m4v | | H.264 | | Ready |
| | | | H.263 | | |
| | | | MPEG-4 | | |
| MPEG-2 PS | .mpg | MP3 | MPEG-2 | GStreamer | Ready |

Supported Media Format and Codecs (Sheet 2 of 2) Table 3:

| Containers | Extensions | Audio/Video Combinations | | Playback Engine | Status |
|------------|---------------|-----------------------------|--------|--------------------|-----------|
| | | Audio | Video | | |
| 3GPP | .3gp/ | AAC | H.264 | Stagefright | Ready |
| | .3gpp .3g2 | AAC | H.263 | | |
| | .3gpp2 | AAC | MPEG-4 | | |
| | | AMR- NB/WB | H.264 | | |
| | | AMR- NB/WB | H.263 | | |
| | | AMR- NB/WB | MPEG-4 | | |
| | .3ga | AAC | | Stagefright | Not Ready |
| | | AMR- NB/WB | | | |
| MKV | .mkv | MP3 | H.264 | Stagefright | Ready |
| | | AAC | H.264 | | |
| AAC | .aac | AAC | | GStreamer | Ready |
| | .adts | AAC | | GStreamer | Ready |
| MP3 | .mp3 | MP3 | | Stagefright | Ready |
| WebM | .webm | Ogg | VP8 | Stagefright | Ready |
| TS | .ts | AAC | H.264 | Stagefright | Ready |
| AMR | .amr | AMR- NB/WB | | Stagefright | Ready |

Board Support Package Features 1.4

Board support package features for the ARMADA 610 Tablet Reference Platform for Android 3.2 are as follows.

- U-Boot
 - · eMMC, non-trusted boot
 - · USB Ethernet download
 - · zlmage format support
 - · Support for burning Yet Another Flash File System (YAFFS) image
 - Support for burning an image into eMMC
- Linux Kernel 2.6.35
 - L1 cache
 - · L2 cache
 - · Interrupt controller
 - · Peripheral DMA (PDMA) controller
 - · Memory controller
 - Real-Time Clock (RTC)
 - Operating System Timer (OST)
 - Intel[®] Wireless MMX^{™1} technology
 - General purpose Input Output (GPIO) interrupt request (IRQ)
 - Clock management
 - Single level cell (SLC) NAND flash memory
 - OneNAND flash memory
 - Journaling Flash File System, version 2 (JFFS2) support
 - · Unsorted Block Image File System (UBIFS) support
 - Yet Another Flash File System (YAFFS)
 - MultiMediaCard (MMC3.2 and MMC4.0)
 - Secure Digital (SD)/SDIO (SD1.1 and SD2.0)
 - UART
 - HDMI Audio
 - SSPA drivers
 - ALSA framework
 - Keypad
 - I2C Normal I2C (see, I2C Stability, on page 12)
 - DSI LCD panel (base frame, overlay)
 - HDMI LCD TV path
 - Audio DMA (ADMA) controller
 - Marvell Wireless Memory Management technology
 - USB client
 - Maxim MAX8925 Power Management Integrated Circuit (PMIC) and MAX8649 regulator
 - · Battery driver
 - USB charger
 - USB HOST and USB On-the-Go (OTG)

^{1.} Intel and MMX and related marks are trademarks or registered trademarks of Intel Corporation or its subsidiaries in the United States and other countries.

- Video DMA (VDMA) controller
- WM8994 codec
- Dynamic Voltage and Frequency Management (DVFM)
- · Multi touch
- On key and Reset
- Wi-Fi, Bluetooth on SD8787
- CM3623 Light and Proximity sensor
- HDMI EDID
- Marvell Vmeta[™] technology, a multiple format high-definition video codec supporting multi instances
- ARMv7 mode
- Audio record
- · Power off command
- OmniVision[®] OV5642 5-megapixel SoC sensor support
- · LCD additional mode
- · Capacity keypad
- TPK800 touch
- AUO panel
- FM audio
- CyWee motion sensor
- High-bandwidth Digital Content Protection (HDCP)
- Extended File System, version 4 (ext4) support
- ZSP[®] audio mode

I2C Stability

The power on sequence can impact the I2C stability.

On the Marvell ARMADA 610 Tablet Reference Platform, use the following steps to power on.

- 1. Unplug the USB cable and the power cable to make sure power is off to the board.
- 2. Insert the power cable.
- 3. Press the on-key for about 2 seconds to turn on power to the board.
- 4. Insert the USB cable.

Following these steps ensures that the board is powered by the DC power, not by the USB cable VBUS.

1.5 Release Package Contents

The following tables list and describe the release package for the ARMADA 610 Tablet Reference Platform for Android 3.2, Linux kernel 2.6.35.

Table 4: Prebuilt Binary Files

| Files | Description |
|--|---|
| ARMADA610_ANDROID_HONEYCOMB_PREBUILT_BIN.zip | Prebuilt bin binaries |
| • primary_gpt_8g | Primary GUID partition table (for 8GB eMMC) |
| • secondary_gpt_8g | Secondary GUID partition table (for 8GB eMMC) |
| • system.img | Android system image |
| • userdata.img | Android userdata image |
| • zImage.android | Kernel image |
| • zImage_recovery.android | Recovery kernel image |
| • ramdisk.img | RAM disk image |
| ramdisk_recovery.img | Recovery RAM disk image |
| • vmlinux | Kernel image in ELF |
| System.map | Kernel symbol map |
| • Symbols_lib.tgz | System libraries with symbol |
| • nontrusted/u-boot.bin | Nontrusted U-Boot |
| • nontrusted/ntim_mmp2_nand_bbu_ddr.bin | NTIM header |
| • nontrusted/ntim_mmp2_nand_ddr3_elipda_lg.txt | NTIM description file |
| • nontrusted/MMP2_NTLOADER_3_2_19.bin | NTIM loader |
| • nontrusted/update_droid.zip | Nontrusted update package |
| • trusted/u-boot.bin | Trusted U-Boot |
| • trusted/tim_mmp2_nand_bbu_ddr.bin | TIM header |
| • trusted/tim_mmp2_ddr3_elipda_lg.txt | TIM description file |
| • trusted/MMP2_ntloader_3_2_19.bin | TIM loader |
| • trusted/update_droid.zip | Trusted update package |

The WTM firmware image must be downloaded separately from the Marvell Extranet at *My Products/Cellular & Handheld Solutions/Applications Processors/ARMADA 610 (MMP2) Software/WTM/Version 2.1.8.* Contact your Marvell representative if you have issues about the download.

Table 5: **Source Files**

| Files | Description |
|---------------------------------|--|
| ARMADA610_ANDROID_HONEYCOMB_SRC | Source code tarball (patch based source code) |
| setup_android.sh | Script help to set up the Android code base from the xxx_src.tgz and xxx_patches.tgz |
| android_patches.tgz | Marvell patches to the Android Projects |
| • android_src.tgz | Source code for projects added by Marvell |
| marvell_manifest.xml | Manifest xml file to download the Android source code from Google as a base |
| • kernel_patches.tgz | Marvell patches to kernel_src.tgz |
| • kernel_src.tgz | Kernel base source code |
| • uboot_src.tgz | U-Boot base source code |
| • uboot_patches.tgz | Marvell patches to uboot_src.tgz |
| • obm_src.tgz | OEM Boot Module (OBM) source code |

The non-trusted image module (NTIM), the trusted image module (TIM), and BootLoader (OEM boot module) files provided are designed and customized for use with the associated Marvell hardware platform. Use these files as a reference. You MUST create the NTIM, TIM, and BootLoader with the correct parameters for your design.

Failure to correctly implement the NTIM, TIM, or BootLoader may result in a boot failure or cause an unreliable operation of your device.

For information and assistance in correctly setting up your NTIM, TIM, and BootLoader, see the Marvell Boot ROM or Marvell Wireless Trusted Tool Package documentation or contact your Marvell Applications Engineer or Field Applications Engineer.

For detailed information about the WTPTP release package, see the Marvell® Wireless Trusted Platform Tool Package for Application Processors Software Release Notes (MV-S301673-00).

Doc. No. MV-S302102-00 Rev. -CONFIDENTIAL Copyright © 2011 Marvell Page 14 August 25, 2011 Document Classification: Proprietary Information

Installation

This section provides procedures for

- Identifying an ARMv6 or ARMv7 mode boot
- Programming the binaries onto flash memory with the Marvell eXtreme Debugger
- Downloading Android onto flash memory
- Setting up the Android working directory
- **Building Android**
- Using the optimized OpenSSL for Marvell platforms
- Protecting the HDCP key

See Section 1.5, Release Package Contents, on page 13 for a description of the release package contents.

2.1 **Use the Prebuilt Binaries**

The following procedures provide information for programming binaries onto flash memory using the Marvell eXtreme Debugger.

Identifying an ARMv6 or ARMv7 Mode Boot 2.1.1

The non-trusted image module (NTIM) or the trusted image module (TIM) is updated to switch the processor core from ARMv6 to ARMv7 mode. If the new NTIM or TIM image is burned into flash correctly, the boot ROM switches the core from ARMv6 to ARMv7 mode during the boot. Without a new NTIM, the processor still boots in the ARMv6 mode.

To identify whether the processor is in ARMv6 or ARMv7 mode, use the steps that follow.

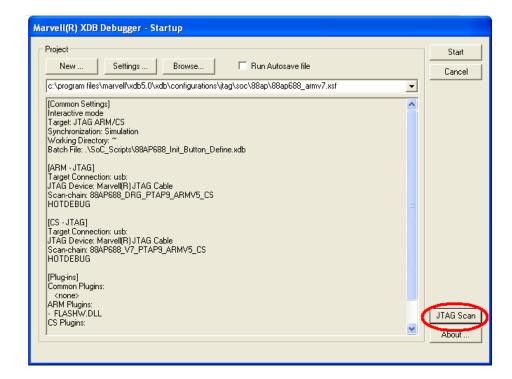

Note

You need the Marvell eXtreme Debugger, version 5.2 Beta 1 or later. Download the Marvell eXtreme Debugger from the Marvell Extranet or contact your Marvell representative.

 With the Marvell eXtreme Debugger (XDB) running, click the JTAG Scan button on the Startup screen.

Figure 1: XDB Debugger JTAG Scan Button

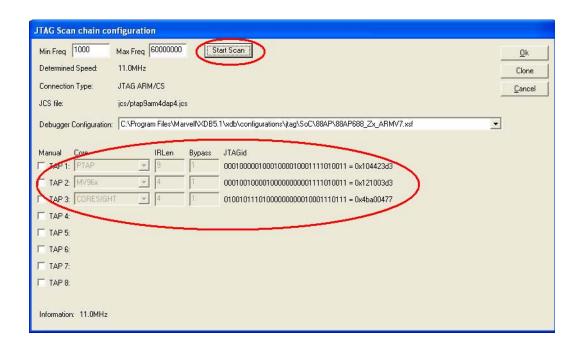

2. Click the Start Scan button.

Figure 2 shows a scan chain that indicates the core mode is in ARMv7 mode.

- Three Test Access Ports (TAPs) indicate the core is in ARMv7 mode.
- Four TAPs indicate the core is in ARMv6 mode

Figure 2: Start Scan Button and JTAG Scan Chain

Burning the Trusted WTM Firmware, OEM Boot Module, and 2.1.2 U-Boot Binaries to eMMC Using JTAG

Perform the steps that follow to burn the trusted WTM firmware, OEM boot module (OBM), and U-Boot binaries to eMMC flash memory using JTAG.

You need the Marvell eXtreme Debugger, version 5.2 Beta 1 or later. Download the Marvell eXtreme Debugger from the Marvell Extranet or contact your Marvell representative.

- 1. Use the Marvell eXtreme Debugger (XDB), version 5.2 Beta 1 and the appropriate configuration file for the steps that follow:
 - If the processor boots in the ARMv6 mode, use the pxa688 _a0_armv6.xsf file.
 - If the processor boots in the ARMv7 mode, use the pxa688 _a0_armv7.xsf file. Leave all settings at their default settings.

To identify in which mode your processor boots, see Section 2.1.1, Identifying an ARMv6 or ARMv7 Mode Boot, on page 15.

- 2. With XDB running, select **Flash** on the toolbar menu.
- Click Burn Flash on the drop-down menu.
- 4. In the Board field, select 88AP688 A0, and in the Flash field, select EMMC Flash (see Figure 3 on page 19).

If you are using the 88AP688 Z0/Z1 stepping processor, select 88AP688_ZX in the Board field instead.

Check the Enable new BBM check box and click the Detect button to detect the eMMC partition (see Figure 3).

Doc. No. MV-S302102-00 Rev. -CONFIDENTIAL Copyright © 2011 Marvell Page 18 Document Classification: Proprietary Information August 25, 2011

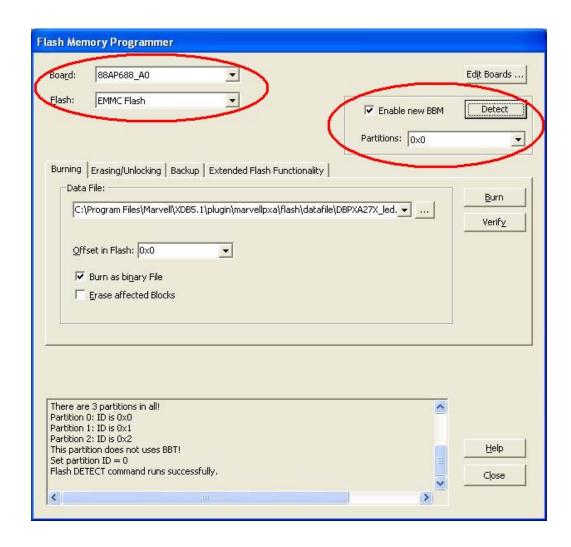

Figure 3: eMMC Flash Detect eMMC Partition

Select partition **0x1**. Burn the following binary files to the addresses as follows:

tim_mmp2_nand_bbu_ddr.bin --> 0x0Wtm_rel_mmp2.bin --> 0x4000MMP2_TLOADER_3_2_19.bin --> 0x30000u-boot.bin --> 0x60000 u-boot.bin (as recovery u-boot) --> 0xB0000

The Wtm_rel_mmp2.bin image is a loadable WTM kernel firmware binary image that is executed by the ARMADA 610 on-chip secure processor. This image provides the cryptographic services for both Federal Information Processing Standard (FIPS) and non-FIPS mode operations.

To acquire the image, download the WTM Firmware ARMADA610 2.1.8.zip file from the Marvell Extranet at My Products/Cellular & Handheld Solutions/Applications Processors/ ARMADA 610 (MMP2)/Software/WTM/Version 2.1.8.

Once downloaded, extract both wtm_rel_mmp2_virtualOTP_2.1.8.bin and wtm rel mmp2 realOTP 2.1.8.bin images from the zip file. Both binary images support the same set of WTM primitive functions with the same API definition. However, the wtm_rel_mmp2_virtualOTP_2.1.8.bin binary image performs the device RKEK/EC521-DK provision with primitives using the buffers within the secure SRAM to emulate the provisioning over the FUSE/OTP macro. On the other hand, the wtm rel mmp2 realOTP 2.1.8.bin image performs the device key provision with primitives directly operating over the FUSE/OTP macro. With real OTP operation, the performed platform provision becomes permanent.

It is recommended to use the virtual OTP version of the WTM kernel binary image for platform software development. To do this, change the binary image file name wtm_rel_mmp2_virtualOTP_2.1.8.bin to Wtm_rel_mmp2.bin.

It is recommended to use the real OTP version of the WTM kernel binary image for the device that is ready to be deployed as a product. To do this, change the binary image file name wtm_rel_mmp2_realOTP_2.1.8.bin to Wtm_rel_mmp2.bin.

2.1.3 Burning the Non-trusted WTM Firmware, OBM, and U-Boot **Binaries to eMMC Using JTAG**

Perform the steps that follow to burn the non-trusted WTM firmware, OBM and U-Boot binaries to eMMC flash memory using JTAG:

You need the Marvell eXtreme Debugger, version 5.2 Beta 1 or later. Download the Marvell eXtreme Debugger from the Marvell Extranet or contact your Marvell representative.

- 1. Use the Marvell eXtreme Debugger (XDB), version 5.2 Beta 1 or later and the appropriate configuration file for the steps that follow:
 - If the processor boots in the ARMv6 mode, use the pxa688 _a0_armv6.xsf file.
 - If the processor boots in the ARMv7 mode, use the pxa688 _a0_armv7.xsf file. Leave all settings at their default settings.

To identify in which mode that your processor boots, see Section 2.1.1, Identifying an ARMv6 or ARMv7 Mode Boot, on page 15.

- 2. Burn OBM and U-Boot into eMMC flash memory using XDB:
 - a) In XDB, select Flash on the toolbar menu. Click Burn Flash on the drop-down menu.
 - b) In the Board field, select 88AP688_A0, and in the Flash field, select EMMC Flash (see Figure 4 on page 22).

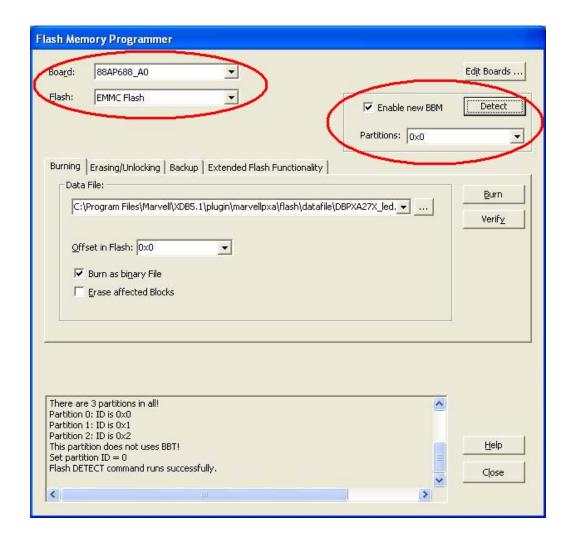

If you are using the 88AP688 Z0/Z1 stepping processor, select 88AP688_ZX in the Board field instead.

c) Check the Enable new BBM check box and click the Detect button to detect the eMMC partition (see Figure 4).

Figure 4: eMMC Flash Detect eMMC Partition

d) Select partition **0x1**. Burn the following binary files to the addresses as follows:

ntim mmp2 nand bbu ddr.bin --> 0x0Wtm_rel_mmp2.bin --> 0x4000MMP2_NTLOADER_3_2_19.bin --> 0x20000--> 0x60000 u-boot.bin u-boot.bin (as recovery u-boot) --> 0xB0000

The Wtm_rel_mmp2.bin image is a loadable WTM kernel firmware binary image that is executed by the ARMADA 610 on-chip secure processor. This image provides the cryptographic services for both Federal Information Processing Standard (FIPS) and non-FIPS mode operations.

To acquire the image, download the WTM Firmware ARMADA610 2.1.8.zip file from the Marvell Extranet at My Products/Cellular & Handheld Solutions/Applications Processors/ ARMADA 610 (MMP2)/Software/WTM/Version 2.1.8.

Once downloaded, extract both wtm_rel_mmp2_virtualOTP_2.1.8.bin and wtm rel mmp2 realOTP 2.1.8.bin images from the zip file. Both binary images support the same set of WTM primitive functions with the same API definition. However, the wtm_rel_mmp2_virtualOTP_2.1.8.bin binary image performs the device RKEK/EC521-DK provision with primitives using the buffers within the secure SRAM to emulate the provisioning over the FUSE/OTP macro. On the other hand, the wtm_rel_mmp2_realOTP_2.1.8.bin image performs the device key provision with primitives directly operating over the FUSE/OTP macro. With real OTP operation, the performed platform provision becomes permanent.

It is recommended to use the virtual OTP version of the WTM kernel binary image for platform software development. To do this, change the binary image file name wtm_rel_mmp2_virtualOTP_2.1.8.bin to Wtm_rel_mmp2.bin.

It is recommended to use the real OTP version of the WTM kernel binary image for the device that is ready to be deployed as a product. To do this, change the binary image file name wtm_rel_mmp2_realOTP_2.1.8.bin to Wtm_rel_mmp2.bin.

2.1.4 Burning Android on eMMC Using U-Boot

Use the U-Boot commands that follow to tftp zImage.android, primary_gpt_8g, secondary_gpt_8g, ramdisk.img, and system.img to eMMC flash memory.

The following procedures require the connection of the USB cable for USB Ethernet between the host Linux PC and the ARMADA 610 Tablet Reference Platform.

After the first TFTP command is issued, use the ifconfig utility to set the host side USB0 connection to 192.168.1.100. The Network File System (NFS) server is fixed as 192.168.1.100:/nfs/android. If you want to change it, modify vendor/marvell/brownstone/rootdir/rdinit and build the kernel again.

You do not see the USB0 Ethernet interface on the Linux host until AFTER the first TFTP "t" command is issued from U-boot.

1. By default, the initial partition is set to 0. Alternately, you can run the following instructions to make sure.

```
MMP2 --> mmc sw_part 0
```

2. Burn GPT.

```
MMP2 --> t primary_gpt_8g
```

MMP2 --> mmc write 0 0x22 0x1100000

MMP2 --> t secondary_gpt_8g

MMP2 --> mmc write 0xecafdf 0x21 0x1100000

3. Burn the kernel

```
MMP2 --> t zImage.android
```

MMP2 --> mmc write 0x4c00 0x2000 0x1100000

4. Burn the ramdisk image.

```
MMP2 --> t ramdisk.img
```

MMP2 --> mmc write 0x8C00 0x800 0x1100000

5. Burn the system image.

```
MMP2 --> t system.img
```

MMP2 --> mmc write 0xCC00 0x4b000 0x1100000

6. Burn the userdata image.

```
MMP2 --> t userdata.img
```

MMP2 --> mmc write 0x57c00 0x4b000 0x1100000

7. Recover the images.

```
MMP2
           --> t zImage recovery.android
MMP2
           --> mmc write 0xa2c00 0x2000 0x1100000
MMP2
           --> t ramdisk_recovery.img
MMP2
           --> mmc write 0xa6c00 0x800 0x1100000
```

When you are done, power off the ARMADA 610 Tablet Reference Platform and power it on again to boot from eMMC.

Rebooting by pressing the reset button does not work.

2.2 **Use the Patch-based Source Code**

The source code package includes the code for the kernel, U-Boot, Android, and everything needed to boot Android on an ARMADA 610 Tablet Reference Platform with the ARMADA 610 processor with A0/A1/A2 stepping and 1GB of DDR3 memory.

The Android code is provided as a group of patches based on a certain version of Android source code. A manifest file is provided to download that version of Android code from the Android Open Source Project (AOSP) at http://source.android.com.

The kernel and U-Boot are provided as a tar ball of base code and a tar ball of patches Marvell made

2.2.1 Setting Up the Android Working Directory

Use the steps that follow to set up the code base.

Check the version of your Git. You can do this by typing git version. If the Git version is 1.6.x.x. You can go ahead with it.

If the Git version is 1.7.1.x or later, open the ~/.gitconfig file and add the following section:

[am]

keepcr=true

If the Git version is 1.7.0.x, upgrade your Git to a version later than 1.7.1.x. You can download the package from http://git-scm.com/download.

- 1. Go to http://source.android.com to download the "repo" tool and set up the build environment for Android.
- 2. Create the Android working directory and download the initial code base.

```
$ mkdir <android_working_dir>
$ cd <android_working_dir>
$ repo init -u ssh://partner.source.android.com:29418/platform/manifest -b
honeycomb-mr2-release
$ repo sync
```

- 3. Switch the code base specified by marvell_manifest.xml.
 - \$ cp <installed_source_dir>/marvell_manifest.xml .repo/manifests/
 - \$ repo init -m marvell_manifest.xml
 - \$ repo sync
- 4. Apply the Marvell patches:
 - \$ cd <installed_source_dir>
 - \$./setup_android.sh <android_working_dir>

2.2.2 Building the Source Code

Use the steps that follow to build Android.

- 1. Build the kernel and modules:
 - \$ cd <android_working_dir>
 - \$ cd kernel
 - \$ make all

The location of the zImage is at kernel/out/and the location of the modules is at kernel/out/modules.

Build U-Boot and OBM:

Before building U-Boot and OBM, extract wtm_rel_mmp2_virtualOTP_2.1.8.bin from WTM_Firmware_ARMADA610_2.1.8.zip which you can get from the Marvell Extranet. Rename it as Wtm_rel_mmp2.bin and copy it to boot/obm/binaries.

Note

The WTM firmware image must be downloaded separately from the Marvell Extranet at *My Products/Cellular & Handheld Solutions/Applications Processors/ARMADA 610 (MMP2) Software/WTM/Version 2.1.8.* Contact your Marvell representative if you have issues about the download.

Issue the following commands:

- \$ cd <android_working_dir>
- \$ cd boot
- \$ make all

The u-boot.bin and OBM files are at boot/out/nontrusted, while the unified WTM files are at boot/out/.

Doc. No. MV-S302102-00 Rev. -CONFIDENTIALCopyright © 2011 MarvellPage 26Document Classification: Proprietary InformationAugust 25, 2011

3. Build android:

```
$ cd <android_working_dir>
```

- \$. build/envsetup.sh
- \$ chooseproduct brownstone
- $\$ choosevariant

 variant> //Select "user" as the build variant if you are
- a normal user. Select "userdebug" or "eng" to specify what you want to do.
- \$ export ANDROID_PREBUILT_MODULES=kernel/out/modules/
- \$ make j4

The location of the Android GPTs, ramdisk.img, system.img, and update_droid.zip files are at out/target/product/brownstone.

2.2.3 **Using the Optimized OpenSSL for Marvell Platforms**

An OpenSSL patch is included in this platform release. This patch fixes a SHA384/512 bug in Android OpenSSL, and optimizes the Android OpenSSL cryptographic library for Marvell platforms. By default, the SHA384/512 bug fix is enabled, the optimization is disabled.

To enable the optimization, this patch requires the Marvell Wireless Trusted Platform Service Package (WTPSP) in this platform release. See the WTPSP release notes for information about how to enable it. Contact your Marvell representative if you have any issues with this package.

When the optimization is enabled, the following OpenSSL cryptographic schemes are optimized: SHA1/224/256, MD5 message digest, AES (CBC mode), RC4 and DES (CBC, CBC3 mode).

Note

Whether the optimization is enabled or not enabled, the Android OpenSSL cryptographic API stays unchanged. Thus, applications using the OpenSSL cryptographic library do not need to be modified. However, an application rebuild is required when the optimization is enabled.

To enable Marvell optimization for OpenSSL:

- 1. Put the Marvell WTPSP middleware library and header file into <android_working_dir>/external/openssl/crypto/ and rename it as libwtpsp.a.
- 2. Add the following into external/openssl/include/openssl/opensslconf.h.

```
#ifdef _ARM_
#ifndef OPENSSL_MRVL
#define OPENSSL_MRVL /* enable marvell crypto support */
#endif
#endif
```

- 3. Add the following into vendor/marvell/brownstone/BoardConfig.mk. USE_MARVELL_CRYPTO := true
- Build the Android system image.

2.3 Protect the HDCP Key

The ARMADA 610 platform supports the high-bandwidth digital content protection (HDCP) protocol that is communicated across the display port, digital visual interface (DVI), high-definition multimedia interface (HDMI), gigabit video interface (GVIF), or unified display interface (UDI) connection.

To protect the device unique HDCP key set (40 keys with each 56 bits) used for streaming multimedia data ciphering, as well as the key select vector (40-bit KSV) for the HDCP authorization, HDMI/HDCP service in the Android package is capable of wrapping the HDCP key set during device HDCP provisioning through the WTPSP and WTM, and loading the HDCP key set into the platform HDCP key register during the platform booting sequence through the WTPSP and WTM.

Marvell does not provide any HDCP key. To enable HDCP, get the HDCP key from Digital Content Protection, LLC: http://www.digital-cp.com/

To protect the HDCP key on the ARMADA 610 platform, use the steps that follow.

- When building your Android code base, set up a proper configuration file in /system/etc/HDCP/config, indicating the location of the plaintext HDCP key file and where to save the wrapped cipher HDCP key file.
- 2. On the product line when Android boots, push the plaintext HDCP key file into the device at /plaintext_key_file_path/plaintext_key_file_name indicated by the configuration file through ADB.

In the next power cycle when Android boots and the HDMI service is launched, the plaintext HDCP key is automatically wrapped to a cipher HDCP key. The cipher key file is saved at the <code>/cipher_key_file_path/cipher_key_file_name</code> indicated by the configuration file. The plaintext key file is deleted.

Once the HDCP key is wrapped, HDMI service loads the cipher key into the platform HDCP key registers.

A sample of the configuration file:

/HDCP/p_key.img;
/HDCP/c_key.img;

The format of the plaintext HDCP key, p_key.img, should be 5 bytes of the KSV + 3 bytes of 0x00 + 280 bytes of private keys.

HDCP key wrapping can be done multiple times, if desired, on the product line in the Device Manufacturing (DM) life cycle.

Recovery and Updates

This section provides procedures for

- Using the recovery and update features
- Checking device requirements
- Checking the kernel and U-Boot requirements
- Customizing the update

3.1 **Recovery and Update Features**

The following sections provide information about the following features:

- Burning recovery images
- Entering recovery mode
- Performing a factory reset
- Using the update package
- Using fastboot

3.1.1 **Burning Recovery Images**

To enable the recovery and update features, two additional images are required:

- zImage_recovery.android
- ramdisk_recovery.img

Burn these images to eMMC flash memory as follows.

```
MMP2 --> t zImage_recovery.android
MMP2 --> mmc write 0xa2c00 0x2000 0x1100000
MMP2 --> t ramdisk_recovery.img
MMP2 --> mmc write 0xa6c00 0x800 0x1100000
```

3.1.2 **Entering Recovery Mode**

On the Marvell ARMADA 610 Tablet Reference Platform, the system enters Recovery mode if the user powers on the device and presses the Home button. An icon is displayed when the system enters Recovery mode.

Figure 5: Recovery Mode Icon

Pressing the Home button switches the screen between the Recovery menu and the background

The Recovery menu contains four options:

- reboot system now
- apply update from /sdcard
- wipe data/factory reset
- wipe cache partition

Use the Menu and Back buttons to move the highlight to the desired option. Use the Search button to select the option.

When the "apply update from /sdcard" option is selected and the system is installing the update, the background is set to the installing icon (see Figure 6).

Figure 6: Installing Icon

3.1.3 **Performing a Factory Reset**

The factory reset is a user interface interaction which erases data and the cache partition. If "Settings => Privacy => Factory data reset" is selected, the system reboots in Recovery mode to erase data and cache.

3.1.4 Using the Update Package

To update using the SD card, put the update package on the SD card and reboot the device by pressing the appropriate button to enter Recovery mode (see Section 3.1.2, Entering Recovery Mode, on page 29). Then, select the menu option "apply update from /sdcard," select the update package, and start the update.

To update in Over-the-Air (OTA) mode, implement an Android service to check if a new update package is ready in the OTA server, download the update package to the device, and reboot the device in Recovery mode to process the update.

3.1.5 **Using Fastboot**

Fastboot is a protocol used to update the flash filesystem in Android devices from a host over USB. The system enters the Fastboot mode if the user powers on the device and presses the Menu button. A partition table is displayed in the host console when the system enters the Fastboot mode.

To make use of fastboot, you need the fastboot program compiled for your host computer (the location should be out/host/linux-x86/bin/fastboot).

Here are the commands you can run on your host after fastboot has been started on a device connected via USB. You can get command hints from the fastboot binary's "--help" command:

```
Usage: fastboot [ <option> ] <command>
```

Commands:

```
flash <partition> [ <filename> ] Writes a file to a flash partition
erase <partition>
                                        Erases a flash partition
                                        Reboots the device normally
reboot
```

Options:

```
Erases userdata and cache
                                       Specifies the device serial number
-s <serial number>
                                       Specifies the product name
-p product>
```

You can use fastboot to burn all images to eMMC flash memory as follows. If the target image is in current path, you can omit the filename option.

```
# fastboot flash kernel [<image path>/zImage.android]
# fastboot flash ramdisk [<image path>/ramdisk.img]
# fastboot flash system [<image path>/system.img]
# fastboot flash reckernel [<image path>/zImage_recovery.android]
# fastboot flash recovery [<image path>/ramdisk_recovery.img]
```

You can put all images in the current path and use flashall to burn all images with one command:

```
# fastboot flashall
```

3.2 **Device Requirements**

3.2.1 **Key Layout**

The ARMADA 610 Tablet Reference Platform boots normally when the On/Off power button is pressed. The device enters a Recovery mode if the user presses the appropriate button.

Several other keys (buttons) are required to operate the menu in the Recovery mode, such as the Home and Back buttons for moving the highlight to an option, the Search button for selecting an option, and so on. See Section 3.1.2, Entering Recovery Mode, on page 29 for a description of these buttons.

For the location and description of the ARMADA 610 Tablet Reference Platform buttons, see the ARMADA 610 Tablet Reference Platform, Revision 4 User's Guide, MV-L100809-100.

3.2.2 eMMC Partition

To enable the recovery feature, four more partitions must be added:

- kernel recovery partition
- RAM disk recovery partition
- misc partition
- cache partition

The misc partition is used for interaction between recovery and the BootLoader. The cache partition is used for interaction between recovery and the main system.

Use the GUID Partition Table (GPT) partition method instead of Master Boot Record (MBR) to support more partitions. Use the "parted" command to generate the GPT table; include the primary and secondary GPT header.

Make a partition image with the same size as the on-board flash memory. For example, generate an 8GB image file, gpt.img:

```
# dd if=/dev/zero of=gpt.img bs=512 count=15511551 // 15511551 blocks in 8GB
flash, 512 bytes per block
```

- 2. Format and partition the image file:
 - a) Enter the partition program.

```
# parted qpt.img
```

b) Format the image file as GPT.

```
# (parted) mklabel gpt
```

c) Change the unit to byte.

```
# (parted) unit b
```

d) Add a new partition "ramdisk".

```
# (parted) mkpart
# Partition name? [ ]? ramdisk
# File system type? [ext2]?
# Start? 18350080
                          // 0x8c00 * 512 = 18350080
# End? 26738687
                          // 0xcc00 * 512 - 1 = 26738687
```

e) You can also rename the partition.

```
# (parted) name 1
                      // the number is the index number of the partition
# Partition name? [ramdisk] ramdisk
```

Doc. No. MV-S302102-00 Rev. -CONFIDENTIAL Copyright © 2011 Marvell f) Add more partitions; follow the previous steps.

- 1. At any time, you can use the "print" command to check the partition information.
 - # (parted) print
- The order you create new partitions is the order listed in the GPT table. It is the order recognized in uboot/kernel.

If you create partitions in the following sequence: ramdisk -> android_system -> android_data -> ... Then, partition "ramdisk" is mmcblk0p1, "android_system" is mmcblk0p2, "android_data" is mmcblk0p3,

If you create partitions in this sequence: kernel -> ramdisk -> android_system -> ... Then, partition "kernel" is mmcblk0p1, "ramdisk" is mmcblk0p2, "android_system" is mmcblk0p3,

- 3. At any time, you can type "?" for more details for help.
 - # (parted) ?
- g) Quit the partition program.
 - # (parted) quit
- 4. Get the GPT table from the image file:
 - # dd if=gpt.img of=primary_gpt bs=512 count=34
 - # dd if=gpt.img of=secondary_gpt bs=512 count=33 skip=15511519

On Marvell ARMADA 610 Tablet Reference Platform, the partition table is as follows.

| Partition | Start Block Address | End Block Address | Block Size | Byte Size | Device Name |
|------------------|------------------------|----------------------|---------------|-----------|-------------|
| kernel | 0x4c00 | 0x8c00 | 0x4000 | 8MB | mmcblk0p8 |
| ramdisk | 0x8c00 | 0xcc00 | 0x4000 | 8MB | mmcblk0p1 |
| android system | 0xcc00 | 0x57c00 | 0x4b000 | 150 MB | mmcblk0p2 |
| android data | 0x57c00 | 0xa2c00 | 0x4b000 | 150 MB | mmcblk0p3 |
| kernel recovery | 0xa2c00 | 0xa6c00 | 0x4000 | 8MB | mmcblk0p9 |
| ramdisk recovery | 0xa6c00 | 0xaac00 | 0x4000 | 8MB | mmcblk0p5 |
| misc | 0xaac00 | 0xab000 | 0x400 | 512 KB | mmcblk0p6 |
| cache | 0xab000 | 0xf6000 | 0x4b000 | 150 MB | mmcblk0p7 |
| mass storage | 0xf6000 | 0xecafdf | 0xdd4fdf | 7082 MB | mmcblk0p4 |

Kernel and U-Boot Requirements 3.3

The following sections list kernel and U-Boot requirements.

3.3.1 **Kernel Requirements**

The reboot () system call with the "recovery" parameter must set a register bit to inform the BootLoader to enter Recovery mode and to reset the bit after entering Recovery mode.

3.3.2 **U-Boot Requirements**

U-Boot must perform the following procedures:

- Detect the appropriate key and enter the Recovery mode if the Home button key is pressed.
- Check the recovery indication register bit and enter the Recovery mode if the bit is set, then
- Read the misc partition, if the buffer is equal to "boot-recovery", enter the Recovery mode; if the buffer is equal to "update-firmware," get the BootLoader image from misc and reflash itself.
- Support fastboot protocol. Detailed information is at the following location: bootable/bootloader/legacy/fastboot_protocol.txt

Update Customization 3.4

The following sections describe how to customize generating the update package, signature, and certification.

3.4.1 Generating the Update Package

The update package is a ZIP file containing an update binary, an update script, some certification information, and all the files needed for the update. The directory structure is as follows.

```
|-- META-INF
    -- CERT.RSA
    -- CERT.SF
    -- MANIFEST.MF
    |-- com
        |-- google
            -- android
                 |-- update-binary
                 |-- updater-script
|-- system/...
|-- <other folders>/...
|-- zImage
|-- <other images>
```

Doc. No. MV-S302102-00 Rev. -CONFIDENTIAL Copyright © 2011 Marvell Document Classification: Proprietary Information August 25, 2011

The update packages can be generated automatically in the Android system build. In the system, the update binary and all the files needed for the update are copied to a specific folder. In addition, the update script is generated by several Python tools.

If you want to customize an update package, for example, just update one or several .so files or apk files, generate the package manually as follows.

1. Make an update folder and copy all folders and files into it:

```
# mkdir <update folder>
# cp -p -r <folds and files need to update> <update folder>
```

2. Make a meta info folder, copy the updater binary to it, and create an update script:

```
# mkdir -p META-INF/com/google/android
```

3. Compress the update folder:

```
# zip -qry ../update.zip .
```

3.4.2 **Generating the Signature and Certification**

By default, the update process uses the Android test key pair to sign the update package, testke.x509.pem and testkey.pk8 in build/target/product/security/. The signature using the private key is done in the build process and the public key is dumped to the recovery RAM disk at the same time. The recovery process verifies the update package before extracting and upgrading the package.

To use a customized key, follow these steps:

1. Generate the private key:

```
# openssl genrsa -3 -out customer_key.pem 2048
```

2. Generate the certification:

```
# openssl req -new -x509 -key customer_key.pem -out customer_key.x509.pem
-days 10000
```

3. Turn the private key to PKCS #8 standard:

```
# openssl pkcs8 -in customer_key.pem -topk8 -outform DER -out customer_key.pk8
-nocrypt
```

- 4. Sign the update.zip by <android>/out/host/linux-x86/framework/signapk.jar: # java -Xmx512m -jar signapk.jar -w customer_key.x509.pem customer_key.pk8 update.zip update_signed.zip
- 5. Using <android>/out/host/linux-x86/framework/dumpkey.jar, dump the public key and build in the recovery ramdisk:

```
# java -jar dumpkey.jar customer_key.x509.pem > keys
```

THIS PAGE INTENTIONALLY LEFT BLANK

Marvell Code Performance Analyzer

The Marvell Code Performance Analyzer v2.3 is supported in this release.

4.1 What's New

- Call Stack sampling data collection and corresponding data analysis
- Remote data collection via the Android Debug Bridge (ADB) for the Android device

4.2 **Features**

The following sections provide information about the supported and unsupported features for this release.

4.2.1 **Supported Features**

- Remote data collection via TCP/IP
- Remote data collection via ADB for the Android device
- Target local data collection in a connectionless environment
- Call Stack sampling data collection and corresponding data analysis
- Hotspot sampling data collection and corresponding data analysis
- Counter monitor data collection and corresponding data analysis.
- Real-time counter monitor and post analysis

4.2.2 **Unsupported Features**

The software development kit (SDK) for dynamic code is not supported in this release.

4.3 System Requirements

This release supports the Marvell Code Performance Analyzer, version 2.3. Download this version from the Marvell Extranet website at http://www.marvell.com/extranet. If you do not have a Marvell Extranet user ID, click on the "register" link at http://www.marvell.com and follow the instructions therein.

4.4 Installation

Before running the data collector, go to the /system/bin folder and run the following command to load the kernel driver:

\$./load_mpdc.sh

4.5 Known Issues or Limitations

- Before loading the kernel driver with the load_mpdc.sh command, run the su command on the board. This prevents an "operation not permitted" message.
- It is recommended to first turn off the Marvell Scalable Power Management (MSPM). Otherwise, the Marvell Performance Data Collector (mpdc) may not work normally. Use the following commands to turn off MSPM on your target:
 - echo 0 >/sys/power/mspm/mspm
- When using the command line, if you get the error message "Fail to communicate with daemon:Success", reload your activity and run it to collect the result again.

Copyright © 2011 Marvell CONFIDENTIAL Doc. No. MV-S302102-00 Rev. -Page 37

- When doing remote data collection on the Android target, if the analyzer exits abnormally, the status of the mpdc_svr may still be connected. If this happens, restart the mpdc_svr on the target.
- If the samples/second value is set too large, the events/sample value is adjusted after a calibration to a smaller value, which makes the interrupt happen more frequently. If this happens, the system becomes busy and the mpdc stops after the expected duration is expired. In addition, most of the samples will be located on the process "mpdc_d". In this case, create your activity with a decreased samples/second value and start it.
- When using the command line, multiple activities cannot be started at the same time.
- If you want to make mpdc_svr listen to another port through using the command "mpdc_svr -p <PortNumber>" on the Android target, a segmentation fault occurs.
- Do not set OS_TIMER as the event in the Event-Based Sampling (EBS).

Known Issues

This section describes the known issues for the ARMADA 610 Tablet Reference Platform for Android 3.2.

- [MMP2PV-781] [BSP] Simultaneous audio playback and record over 12 hours causes the system to hang.
- [MMP2PV-875] [BSP] The system cannot enter suspend after an I²C read/write operation via Audio/Light Sensor/Camera/PMIC with the suspend/resume switch stress test.
- [MMP2PV-914] [BSP] The system hangs during the camera engine and Vmeta[™] decoding stress test.
- [MMP2PV-777] [Multimedia] The system only displays a line when playing "Metroid_Other_M_Teaser_284x378.mp4."
- [MMP2PV-801] [Multimedia] The system failed to record a raw Adaptive Multi-Rate (AMR) stream and causes the application to hang.
- [MMP2PV-803] [Multimedia] The system crashes when the camcorder repeats a recording 9 times.
- [MMP2PV-828] [Multimedia] The camera stress test case for testing image capture failed and the media server crashed.
- IMMP2PV-839] [Multimedia] Switching between the camera and camcorder causes the application to crash.
- [MMP2PV-864] [Multimedia] One multimedia stream causes the Gallery to hang and requires a system restart to launch the Gallery.
- [MMP2PV-874] [Multimedia] Audio/video playback failed to play some multimedia streams.
- [MMP2PV-908] [Multimedia] The recorded video played with dithering.
- [MMP2PV-910] [Multimedia] The audio voice is not clear.
- [MMP2PV-911] [Multimedia] The test stream played with dithering, particularly when the screen was touched.
- [MMP2PV-913] [Multimedia] The system failed to play some 1080p streams; it displayed the message "this video can't be played."
- [CQ00173924] [Graphics] Unlocking the screen sometimes results in a "wait for condition" error in the log, but the error message does not cause the system to hang.
- [CQ00176558] [Graphics] Running the NenaMark2 application causes the display of a render
- [CQ00176562] [Graphics] When the setting options "About Phone" and "Location & Security" are selected, a red rectangle appears around the entire screen.
- [BT] When using the Audio/Video Remote Control Profile (AVRCP) for the video player, the NEXT button triggers the music player to start "PLAY" during the video playback.
- [Multimedia] WebM playback is jerky.
- [Multimedia] The playback of .avi and .mov formats sometimes failed.
- [Multimedia] During video playback, sometimes the first frame shows the last video's last screen before exiting the video.
- [Performance] The SunSpider JavaScript benchmark resulted in an 11000+ ms performance.
- [VideoEditor] Some functions are not supported yet.
